

(a) Learning-action feedback

(b) Emergent transition structure

(c) What the model tests

1 ONSET	Can gradual adversity trigger abrupt withdrawal?
2 RECOVERY	Which model control most strongly supports re-engagement?
3 EMPIRICAL	Can dense clinical data recover a previously identified regime shift?

(d) Evidence hierarchy

- MODEL
 Δc , γ , z and transition dynamics
- PRIMARY TRAJECTORY
Wichers: published day-127 transition recovered
- SECONDARY VALIDATION
Action history and sparse trajectories
- DIRECT TEST
Manipulated actions + individual model fitting
